

# Medication Administration Through An Enteral Feeding Tube

Skill	Performed Correctly	N/A
Nurse correctly identified medications that cannot be administered through an enteral feeding tube.		
Nurse held enteral tube feeding for 30 minutes if medication is being administered. Required medication is administered on an empty stomach or one hour if a medication is incompatible with enteral feeding formula.		
Medications were crushed and prepared individually.		
Medications were individual mixed with 10 -15 mL of drinking water.		
The enteral feeding tube was flushed with 30 mL of drinking water before the administration of any medication.		
Nurse flushed the enteral feeding tube with 30 mL of drinking water between each medication.		
Nurse used a 60 mL catheter tip syringe for the administration of medication.		
The syringe was rinsed with drinking water between each medication and administered through the feeding tube.		
Nurse flushed the enteral feeding tube with 30mL of drinking water after all medications were administered.		
Nurse restarted tube feeding after the administration of all medications.
